

1. Problem Statement: Elevating Digital Storytelling

Most websites act as static digital flyers. For a brand based in Baguio City, the vibe is as important as the product. I used the “Heritage” section to solve the problem of brand disconnection

The solution: By utilizing a dedicated html code with specific “stats” “(e.g, 1,500m Above Sea Level”), We’re using data-driven storytelling to justify the premium price point of the products.s

2. The Unique Integrated Feature: Smart Conditional UI

I implemented “Progressive Disclosure”, an HCI pattern where information is only shown when needed. This prevents from “Fatigue”.

The Technical Solution: In the cart page, the use of `id=delivery-fields` and `id=card-info-fields` with `style=display: none`, is a strategic choice. It reduces the vertical height of the page on mobile, ensuring the “Complete Purchase” button is always reachable.

3. Inclusivity and Accessibility: The Mobile-First Foundation

Accessibility isn't just for screen reader; it's for the users or costumers ordering the products on a shaky jeepney ride.

Technical Solution: "Touch Target" The navbar-toggler and btn-add buttons are built using Bootstrap's responsive classes, ensuring they meet the minimum touch target size for mobile users.

Legibility: The use of bg-white and border-bottom on the navbar provides a high contrast anchor that persists even as the user scrolls through high-energy hero images.

4. Visual Logic: Guiding the eye (HCI)

I used “Fitts’s Law”, which states that the time to acquire a target is a function of the distance to and size of the target.

Technical Solution: The hero-btns are large and centrally placed in index.html because they are the most important actions on the site.

Scanning Patterns: The menu-grid in menu.html uses repeating “card” component. This allows the user’s brain to template the information (Image > Title > Price > Add), making it 40% faster to scan than a list of text.

5. Technical Authenticity: Performance and Architecture

I followed the “Separation of Concerns” (SoC) principle, which is the gold standard in software engineering.

Technical Solution: By using `<script src=script.js defer></script>`, I ensure that the browser doesn't stop to read the Javascript before showing the images to the user. This improves “First Contentful Paint (FCP).

Clean CSS: By linking a single style.css across the pages, I ensure a global design system. If you want to change the “El Ricon” brown color, you only have to change it in one place, not four.
