

HUMAN-COMPUTER INTERACTION 1
2nd Semester SY 2025-2026

SCORE

Name: AGOO, Christian Payapaya

Date: Feb 06, 20206

Course and Year: BSIT 1

Section: IDA6

1. Reducing Cognitive Load (ADHD-Friendly Design)

- **Visuals** I used a tabbed system (Daily, Weekly, Monthly) to practice Progressive Disclosure. I'm making sure the user only sees what they need right now, preventing that feeling of being overwhelmed by a massive to-do list.
- **Color Choice** I chose specific yellow, red and purple hues as pre-attentive cues. I want the brain to know where it is based on color before the user even has to read a single word.
- **Navigation:** By keeping the sidebar icons in a fixed vertical layout, I'm leaning into spatial consistency. The goal is for navigation to become muscle memory, so "finding" the controls never drains the user's limited battery of focus.

2. Icons as Anchors (Supporting Dyslexia)

- **Dual Coding:** I pair every label with a clear icon (like the house or the gift box). This creates two pathways to the same meaning. If the word "Monthly" feels hard to process at the moment, the shape and position of the button act as a reliable shortcut.
- **Shape over Syntax:** I prioritize unique geometries to prevent "letter swapping." While similar words can blur together for a dyslexic user, a gift box and a target are distinct shapes that the brain recognizes instantly, bypassing the need for heavy phonological processing.
